TITLE: The Problem of a Condenser Field With Circular Plates

PERIODICAL: Inshenerno-fizicheskiy zhurnal, 1959, Nr 6, pp 104-110 (USSR)

ABSTRACT: Some problems in the theory of electricity call for determination of the field originated by a condenser with circular plates. There are several approaches to this determination proposed by Serini [Ref 2], Nicholson [Ref 3] and Ignatovskiy [Ref 4], but the presentation of the potential in the form suggested by them leads to complicated calculations. The authors put forward a solution of this problem based on the new approach advanced by N.N. Lebedev [Ref 5] in a paper on electricity distribution on a paraboloidal segment. The determination of field potential is reduced to the solution of Fredholm's one-dimensional integral equation, Formula 12, with a continuous kernel, by means of which an auxiliary function  $\Psi_p(x)$  is found. The final expression for the potential is given by Formula 14 which contains  $K(k)$ , a full elliptic integral of the first kind with the module  $k$ , and the function  $\phi_r(r)$ .

TITLE: On the Dependence of the Intensity of Certain Lines of Helium on Pressure

PERIODICAL: Optika i spektroskopiya, 1959, Vol 7, Nr 4, pp 446-453 (USSR)

ABSTRACT: The authors consider a cylindrical tube filled with helium at a certain pressure  $p$ . A narrow parallel beam of electrons of known velocity is assumed to pass along the tube axis. If the direct excitation of helium atoms by electron collisions is the only source responsible for emission by a given line, and the absorption of this line by helium inside the tube is negligible, then the intensity of this line will be proportional to pressure. Such proportionality was observed experimentally for some helium lines (Ref 2). Other helium lines, however, which also are not absorbed by helium in the tube (for example the 5016 and 3965 Å lines) depend on gas pressure in non-linear fashion. The authors show that in general the intensity of emission and the gas pressure are indeed related non-linearly. This is due to self-absorption effects in the discharge. Figs 2 (5016 Å line) and 3 (3965 Å) show that the

TITLE:

Stationary temperature distribution in a layer under local heating of its boundary

PERIODICAL:

Referativnyy zhurnal, Matematika, no. 12, 1961, 54, abstract 12B233. ("XVIII Nauchn. konferentsiya prof.-prepodatav. sostava Leningr. inzh.-stroit. in-ta s uchastiyem predstavit. stroit. organizatsiy. predpriyatiy i nauchno-tekhn. o-v. Dokl. sektsiy soprotivl. materialov, matem. i teor. mekhan., fiz., khimii i elektrotekhn." L., 1960, 24-29)

TEXT:

In a layer  $|z| \leq h$  the stationary temperature distribution is considered under the assumption that a constant temperature is maintained on the boundaries  $z = \pm h$  in the circles  $r \leq r_0$  (it is different on the lower and on the upper boundary), while outside of the circles a heat exchange with a medium with temperature zero takes place. The author represents the solution as an integral of Fourier-Bessel and reduces the problem to the solution of coupled integral equations which are reducible to Fredholm equations of second kind.

**TITLE:** Characteristics of the Size Distribution of Coke

**PERIODICAL:** Koks i khimiya, 1959, Nr 10, pp 27-30 (USSR)

**ABSTRACT:** In view of the variability of the size distribution of coke which could not be explained by the coking technology, the accuracy of the determination of the size distribution of coke using mechanised screens with square mesh was investigated. It was established that due to the prismatic structure of coke, screening on square mesh screens does not give a correct picture of the size distribution of coke. About 15% of lumps from the fraction 60-80mm finds its way into the 60-40mm fraction. This value is not constant and depends on the structure of the coke. In parallel determinations of the size distribution of coke, deviations in the +40mm fraction amount to 2.5% while the results for the -40mm fraction were more accurate. In large coke sizes about 33% of all lumps possess the coefficient of "columnarity" (ratio of height to width) of 1.1-1.3 and 33% of 1.3-1.5. There are 4 figures and 4 tables.

TITLE: Molecular mechanisms underlying radiation-induced cytogenetic injuries

SOURCE: AMN SSSR. Vestnik, no. 9, 1965, 18-22

TOPIC TAGS: free radical, radiation injury, ionizing radiation, UV radiation, DNA

ABSTRACT: The nature of the injuries produced by different forms of free radicals and by radiation at the cellular and molecular levels is investigated and the local injuries to DNA and DNP are described. The damage to the basic matrix structure of the cell nucleus following ionizing radiation is secondary to the cell's direct absorption of radiant energy. This damage cannot be duplicated by the action of free radicals or ultraviolet radiation. There is a difference between the primary physicochemical changes in DNA and DNP arising from ionizing radiation, free radicals,

TITLE: Solving Boolean equation systems

PERIODICAL: Aplikace matematiky, v. 7, no. 4, 1962, 265-271

TEXT: The article, mainly based on Western publications, indicates the use of Boolean algebras in the synthesis of logical networks; describes one of the well-known algorithms for practical solution of a system of Boolean equations with  $n$  unknowns; and lists as an example, the complete solution of a Boolean equation with one unknown. The possibility of using Boolean algebras in logical design is explained with the aid of four examples where logical networks are transformed from one into another form, where the state of a memory element at a given time  $(t + 1)$  is described dependent on its previous state at the original time  $(t)$ , and where correlations of transition codes have to be formulated. It is then shown that each system of Boolean equations can be expressed by a single canonical equation

Card 1/4

Solving Boolean equation systems

Z/026/62/007/004/002/004  
D407/D301

$$\sum_{i=0}^{2n-1} \Lambda_i X_i = 0 \quad (13)$$

where  $X_i$  are basic conjunctions of all variables  $x_1, x_2, \dots, x_n$ , corresponding with the index of state  $i$ , and  $\Lambda_i$  are certain functions of the variables  $a_1, a_2, \dots, a_m$ . The solution of equation (13) consists in finding all those expressions for  $x_p$  in the form of

$$x_p = F_p(a_1, a_2, \dots, a_m), \quad p = 1, 2, \dots, n. \quad (10)$$

where the left side of equation (13) assumes the value zero after substitution of  $x_p$ . From the various well-known methods, the article describes a solution which consists of the following steps:  
1) Formulation of all unknown  $x_p$ , including their negation  $\bar{x}_p$ , in the form

$$x_p = \sum_{j=0}^{2m-1} K_{p,j} \cdot \alpha_j, \quad p = 1, 2, \dots, n \quad (14)$$

Card 2/4

Solving Joolean equation systems

Z/026/62/007/004/002/004  
D407/D301

$$\bar{x}_p = \sum_{j=0}^{2^m-1} \bar{K}_{p,j} \cdot \alpha_j, \quad (14)$$

where  $\alpha_j$  are basic conjunctions of the variables  $a_1, a_2, \dots, a_m$ , corresponding to the index of state  $j$ , and  $\bar{K}_{p,j}$  are sofar unknown constants which may assume the value 0 or 1. 2) Substitution of  $x_p$  and  $\bar{x}_p$  ( $p = 1, 2, \dots, n$ ) into equation (13) and factoring-out of same basic conjunctions  $\alpha_j$  ( $j = 0, 1, \dots, 2^m-1$ ). The coefficients thus originating at individual conjunctions  $\alpha_j$  are designated  $X_j$  ( $j = 0, 1, \dots, 2^m-1$ ). 3) In case of coefficients  $X_j = 1$ , the corresponding conjunction must be  $\alpha_j = 0$ . In all other conjunctions, one can assume  $X_j = 0$ , and from the equations thus obtained, one can determine the suitable selection  $n \cdot 2^m$  of numbers  $K_{p,j}$ . By substituting  $K_{p,j}$  into equation (14), one arrives at solutions of equation (10) and equation (13). It is also indicated that the problem of minimizing the number of symbols in Boolean functions can be solved with the aid of Svoboda maps (Ref. 4: A. Svoboda: Graphical-mechani-

10010. PNEUMATIC RELAYS. 1.00.

001.000

Abstracts, Vol. 12, No. 1, 1967-1968, in Czech.  
The results of an experimental investigation of pneumatic relays are reported. The samples were made of Nichrome-50 tubes having a width of 10 mm, thickness of 1.5 mm and length of 40 to 60 mm, and were provided with thin Al-film electrodes and fixed to metal angles. The free ends of the tubes were furnished with small Portholite disks which served as buffers for the contact springs. The relays were provided with four contacts based on standard spring sets. It was found that: (1) the operating speed of the relays was approximately the same as that of the corresponding electromagnetic relays; (2) power consumption of the relays was about 10<sup>-3</sup> times lower than that of electromagnetic devices; (3) mechanical and thermal properties of the relays were inferior to those of electromagnetic devices, but this could largely be overcome by using boron nitride tubes instead of Nichrome-50.

TOPIC TAGS: computer language, applied mathematics, encoding theory 16<sup>c</sup>

ABSTRACT:

A binary code is defined by a sequence  $\{A_i\}$  of binary numbers  $A_i$  with  $n$  places. The  $k$ -th binary digit of  $A_i$  is denoted by  $1_{k,i}$ . The number of terms in  $\{A_i\}$  is called length of the code. Relations between  $n$  and maximal length are derived for codes which fulfill both the following conditions:

1.  $a_{i,k} = a_i$  for  $i = 1, 2, \dots, L-1$ , and for  $k = 0, 1, \dots, n-2$ .

2.  $\sum_{k=0}^{n-1} |a_i - a_{i,k}| = p$  for  $i = 1, 2, \dots, L-1$ .

For  $p \neq n$ , the maximal length of such codes is either  $2n$  (for  $p$  odd) or  $n$  (for  $p$  even). Orig. art. has 7 formulas.

TITLE: Logical design of sequential asynchronous switching circuits

SOURCE: Ceskoslovenska akademie ved. Vyskumny ustav matematickych stroju. Stroje na spracovani informaci, no. 11, 1965, 135-166

TOPIC TAGS: switching circuit, internal code, linear graph, memory element

ABSTRACT: This paper contains a methodical approach to the logical design of sequential asynchronous switching circuits. All necessary steps in the design are described, but the main attention is concentrated on the assignment of an internal code. Logical features of memory elements are also discussed, and some practical results are contained in the paper. The behavior of a sequential asynchronous switching circuit may be represented by a linear graph. Two interpretations of the linear graph, namely a state diagram and a flow table, are used for the design. The procedure of the assignment of an internal code begins with an internal state diagram, all points of which are mutually different in respect to the corresponding states of memory elements. In order to prevent a race of memory elements, it is prescribed that each line of any internal state diagram always represents a change of only one memory element. The number of lines belonging to the shortest path between two points

ACC NR: AT5027856

u and v of an internal of an internal state diagram defines the element  $ou_v$  of the matrix of changes, from which several matrices of distances of the internal code sought may be derived. The question of realizability of a matrix of distances is studied, and two ways of designing an internal code are introduced: a linear-programming approach and marti-comparison method. Some bounds for the number of memory elements are also contained in the paper. The complete design of sequential asynchronous switching circuits is illustrated by several examples. Orig. art. has: 12 figures, 21 tables, and 16 formulas. [Author's abstract] [KB]

Title : Use of Anion Exchanger in Analytical Chemistry. I. Sorp-  
tion of Chloride Complexes of Some Metals on Anion Exchanger  
QAL. II. Separation of Little Amounts of Cobalt from  
Nickel. III. Separation of Little Amounts of Pb, Zn, Cd,  
Sn and Bi from Cu, Co and Fe.

Orig Pub : Chem. listy, 1957, 51, No 8, 1467-1470; 1547-1548; 1549-  
1550.

Abstract : I. The applicability of the strongly alkaline anion ex-  
changer QAL (I) made in Czechoslovakia, the functional group  
of which is a 4-fold bound N, to the analytical separation of  
metal cations was investigated. The elution constants (EC)

Abstr Jour : Ref Zhur - Khim., No 10, 1958, No 32165

of I in respect to  $\text{Ni}^{2+}$ ,  $\text{Mn}^{2+}$ ,  $\text{As}^{5+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Pb}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{Bi}^{3+}$  and  $\text{Sn}^{4+}$  in 0.1 to 12 M HCl were determined. For this purpose, the volume of the eluent (HCl), which was necessary to let through I until the first traces of the corresponding metal would appear in the eluate, was measured, and this volume was referred to 1 ml of I. The EC-s received in this way for various metals differ one from another, which makes it possible, for example, to separate Co from Ni, or Pb, Zn, Cd, Sn and Bi from Cu, Fe and Co. Should the differences among the EC magnitudes of metals to be separated be little, the separation would be repeated several times. In some cases, the EC magnitudes of I differ considerably from corresponding EC magnitudes of other ion exchangers, for example, Dowex-1, Wofatite L 150. The comparatively little

mechanical strength of I is its disadvantage.

II. The possibility of separating Co from Ni using I was investigated. The greatest difference between the EC-s of Co (0.045 to 0.039) and Ni (1.10 to 1.29) is observed in 9 to 12 M HCl. The method developed by the authors is suitable for the separation of little amounts of Co from Ni; many cations sorbing together with Co on I ( $\text{Fe}^{3+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Pb}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{Sn}^{4+}$  and others) interfere with the separation. The sample to be analyzed in the shape of chlorides with a maximum content ( $\sim 10$  mg) of Ni is dissolved in 1 mlit of concentrated HCl and the obtained solution is passed at the rate of about 1 mlit per min. through a microcolumn, capacity about 2 mlit, with I, which has been first washed with concentrated hydrochloric acid. After that the column is washed with concentrated HCl solution (10 mlit) until the reaction

Card 3/5

of  $\text{Ni}^{2+}$  with dimethylglyoxime is negative, and  $\text{Co}^{2+}$  is eluted from I with 10 mlit of water. The Co content in the eluate is determined photometrically using  $\alpha$ -phenylmonoxime or  $\alpha$ -nitroso- $\beta$ -naphthol.

III. A method of separating little amounts of  $\text{Pb}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{Sn}^{4+}$  and  $\text{Bi}^{3+}$  from excessive amounts of  $\text{Cu}^{2+}$ ,  $\text{Co}^{2+}$  or  $\text{Fe}^{3+}$  using I was developed. 0.5 to 3 M HCl is a suitable medium for the separation, because neither  $\text{Cu}^{2+}$ , nor  $\text{Co}^{2+}$ , nor  $\text{Fe}^{3+}$  sorb on I in it. The solution of chlorides of metals to be separated in 1 M HCl is passed through a column with 20 cub.cm of I, which was previously washed with 1 M HCl solution, and I is washed with 1 M HCl solution, until the reactions for  $\text{Cu}^{2+}$  (with benzoinoxime), for  $\text{Co}^{2+}$  (with murexide) and for  $\text{Fe}^{3+}$  (with KSCN) become negative. After

Card 4/5

Inorganic Substances.

E-2

Abs Jour : Ref Zhur - Khim., No 10, 1958, No 32165

that the cations sorbed on I are successively eluted with 100 ml of the corresponding reagent, viz.:  $Pb^{2+}$ ,  $Zn^{2+}$  and  $Sn^{4+}$  with 0.1 M HCl solution,  $Cd^{2+}$  with water, and  $Bi^{3+}$  with 5% aq.  $HNO_3$ .  $Zn^{2+}$ ,  $Cd^{2+}$  and  $Pb^{2+}$  in the eluate are determined complexometrically,  $Sn^{4+}$  is determined photometrically with quercetin, and  $Bi^{3+}$  is determined also photometrically with thiourea. This method is especially suitable for the simple separation of Zn from Cd and permits to determine traces of Cd (0.0006%) in metallic Cu.

TITLE : Mineral Water of the Bishta Health Resort in  
Czechoslovakia  
ORIG. PUB. : Vest. Ustred. ustavn geol., 1958, 33, No 5,  
361-363  
ABSTRACT : Mineral water springs of the Bishta health re-  
sort located near Slovensko Novo Mesto emerge  
from a fault of the tectonic contact with neo-  
genic rhyolites and their tuffs with crystalline  
substrate. This water is hydrocarbonate-chlorido-  
nitric mineral content of 1.62-2.16 gr/l.  
Ionic composition analyses are presented.  
-- V. Krasintseva.
